# Introduction

## Important

Read, understand and obey the safety rules and operating instructions in the appropriate Operator's Manual on your machine before attempting any maintenance procedure.

Basic mechanical, hydraulic and electrical skills are required to perform most procedures. However, several procedures require specialized skills, tools, lifting equipment and a suitable workshop. In these instances, we strongly recommend that maintenance and repair be performed at an authorized Genie dealer service center.

## Compliance

**Machine Classification**
Group A/Type 2,3 as defined by ISO 16368

**Machine Design Life**
Unrestricted with proper operation, inspection and scheduled maintenance.

## Technical Publications

Genie Industries has endeavored to deliver the highest degree of accuracy possible. However, continuous improvement of our products is a Genie policy. Therefore, product specifications are subject to change without notice.

Readers are encouraged to notify Genie of errors and send in suggestions for improvement. All communications will be carefully considered for future printings of this and all other manuals.

## Serial Number Information

Genie Industries offers the following Service Manuals for these models:

<table>
<thead>
<tr>
<th>Title</th>
<th>Part No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(before serial number GR05-5001)</td>
<td></td>
</tr>
</tbody>

Serial Number Legend

MANUFACTURED BY/FABRIQUE PAR:
Genie Industries
18340 NE 76th Street
Redmond, WA 98052 USA

Model: GR-15
Serial number: GR05-1234
Model year: 2008
Manufacture date: 4/14/08
Elec/Hydr Schematic: ES0126/HS0039
Power supply voltage/Pneumatic Pressure:
85-264 VAC, 60/50 Hz, 900 W
Nominal Power: 8.3 Hp / 6.2 kW
Machine unladen weight: 2,250 lbs / 1,021 kg
Max Load: 500 lbs / 227 kg
Occupants and Equipment must not exceed:
500 lbs / 227 kg
Maximum allowable inclination of the chassis:
1.5° (Side) 3° (Front) 3° (Rear)
Maximum Wind Speed:
Indoor: 28 mph / 12.5 m/s
Outdoor: 28 mph / 12.5 m/s
Gradeability: 30%
Maximum allowable side force: 100 lbs / 445 N
Maximum platform height: 14 ft 8 in / 4.47 m
Maximum number of platform occupants: 1
Country of manufacture: USA
This machine complies with:
EN 280
98/37/EC

PN- 77172
Safety Rules

Danger

Failure to obey the instructions and safety rules in this manual and the appropriate Operator's Manual on your machine will result in death or serious injury.

Many of the hazards identified in the operator’s manual are also safety hazards when maintenance and repair procedures are performed.

Do Not Perform Maintenance Unless:

☑ You are trained and qualified to perform maintenance on this machine.

☑ You read, understand and obey:
  - manufacturer’s instructions and safety rules
  - employer’s safety rules and worksite regulations
  - applicable governmental regulations

☑ You have the appropriate tools, lifting equipment and a suitable workshop.
SAFETY RULES

Personal Safety

Any person working on or around a machine must be aware of all known safety hazards. Personal safety and the continued safe operation of the machine should be your top priority.

Read each procedure thoroughly. This manual and the decals on the machine, use signal words to identify the following:

Safety alert symbol—used to alert personnel to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, may cause minor or moderate injury.

Indicates a potentially hazardous situation which, if not avoided, may result in property damage.

Be sure to wear protective eye wear and other protective clothing if the situation warrants it.

Be aware of potential crushing hazards such as moving parts, free swinging or unsecured components when lifting or placing loads. Always wear approved steel-toed shoes.

Workplace Safety

Be sure to keep sparks, flames and lighted tobacco away from flammable and combustible materials like battery gases and engine fuels. Always have an approved fire extinguisher within easy reach.

Be sure that all tools and working areas are properly maintained and ready for use. Keep work surfaces clean and free of debris that could get into machine components and cause damage.

Be sure any forklift, overhead crane or other lifting or supporting device is fully capable of supporting and stabilizing the weight to be lifted. Use only chains or straps that are in good condition and of ample capacity.

Be sure that fasteners intended for one time use (i.e., cotter pins and self-locking nuts) are not reused. These components may fail if they are used a second time.

Be sure to properly dispose of old oil or other fluids. Use an approved container. Please be environmentally safe.

Be sure that your workshop or work area is properly ventilated and well lit.

Hydraulic Specifications

Hydraulic Oil Specifications

- **Hydraulic oil type**: Chevron Rando HD equivalent
- **Viscosity grade**: Multi-viscosity
- **Viscosity index**: 200
- **Cleanliness level, minimum**: 15/13
- **Water content, maximum**: 200 ppm

**Chevron Rando HD oil is fully compatible and mixable with Shell Donax TG (Dexron III) oils.**

Genie specifications require hydraulic oils which are designed to give maximum protection to hydraulic systems, have the ability to perform over a wide temperature range, and the viscosity index should exceed 140. They should provide excellent antiwear, oxidation, corrosion inhibition, seal conditioning, and foam and aeration suppression properties.

**Optional fluids**

- Biodegradable Petro Canada Environ MV 46
  Statoil Hydra Way Bio SE 32
  BP Biohyd SE-S
- Fire resistant UCON Hydrolube HP-5046
  Quintolubric 822
- Mineral based Shell Tellus T32
  Shell Tellus T46
  Chevron Aviation A

**Function pump**

- **Type**: Gear
- **Displacement per revolution**: 0.244 cu in
- **Flow rate @ 2500 psi / 172 bar**: 4 gpm
- **Hydraulic tank return filter**: 10 micron with 25 psi / 1.7 bar bypass

**Function manifold**

- **System relief valve pressure, maximum**: 3500 psi
- **Lift relief valve pressure**: 1800 to 3500 psi
- **Steer relief valve pressure**: 1500 psi

---

**NOTICE** Continued use of Chevron Aviation A hydraulic fluid when ambient temperatures are consistently above 32°F / 0°C may result in component damage.

Note: Use Chevron Aviation A hydraulic fluid when ambient temperatures are consistently below 0°F / -17°C.

Note: Use Shell Tellus T46 hydraulic oil when oil temperatures consistently exceed 205°F / 96°C.

Note: Genie specifications require additional equipment and special installation instructions for the approved optional fluids. Consult the Genie Industries Service Department before use.

**Continuous improvement of our products is a Genie policy. Product specifications are subject to change without notice.**
### Manifold Component Specifications

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### Valve Coil Resistance

Note: The following coil resistance specifications are at an ambient temperature of 68°F / 20°C. As valve coil resistance is sensitive to changes in air temperature, the coil resistance will typically increase or decrease by 4% for each 18°F / -7.7°C that your air temperature increases or decreases from 68°F / 20°C.

Torque Procedure

JIC 37° fittings

1 Align the tube flare (hex nut) against the nose of the fitting body (body hex fitting) and tighten the hex nut to the body hex fitting to hand-tight, approximately 30 in-lbs / 3.4 Nm.

2 Make a reference mark on one of the flats of the hex nut, and continue it on to the body hex fitting with a permanent ink marker. Refer to Figure 1.

3 Working clockwise on the body hex fitting, make a second mark with a permanent ink marker to indicate the proper tightening position. Refer to Figure 2.

4 Tighten the hex nut until the mark on the hex nut is aligned with the second mark on the body hex fitting.

5 Operate all machine functions and inspect the hoses and fittings and related components to confirm that there are no leaks.

### Notes
- This chart is to be used as a guide only unless noted elsewhere in this manual.
- Use the appropriate chart for the specific size and type of bolt.
- Torque values provided are approximate and should be used as a guide.
- Always consult the manufacturer's specifications for the most accurate information.
Scheduled Maintenance Procedures

Observe and Obey:

- Maintenance inspections shall be completed by a person trained and qualified on the maintenance of this machine.
- Scheduled maintenance inspections shall be completed daily, quarterly, semi-annually, annually and every 2 years as specified on the Maintenance Inspection Report.
- Failure to properly complete each inspection when required may cause death, serious injury or substantial machine damage.
- Immediately tag and remove from service a damaged or malfunctioning machine.
- Repair any machine damage or malfunction before operating the machine.
- Use only Genie approved replacement parts.
- Machines that have been out of service for a period longer than 3 months must complete the quarterly inspection.
- Unless otherwise specified, perform each procedure with the machine in the following configuration:
  - Machine parked on a firm, level surface
  - Platform in the stowed position
  - Key switch in the off position with the key removed
  - The red Emergency Stop button in the off position at both ground and platform controls
  - Wheels chocked
  - All external AC power supply disconnected from the machine

About This Section

This section contains detailed procedures for each scheduled maintenance inspection.

Each procedure includes a description, safety warnings and step-by-step instructions.

Symbols Legend

- **Safety alert symbol**—used to alert personnel to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.
- **DANGER** Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
- **WARNING** Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
- **CAUTION** Indicates a potentially hazardous situation which, if not avoided, may cause minor or moderate injury.
- **NOTICE** Indicates a potentially hazardous situation which, if not avoided, may result in property damage.
- Indicates that a specific result is expected after performing a series of steps.
- Indicates that an incorrect result has occurred after performing a series of steps.
SCHEDULED MAINTENANCE PROCEDURES

Maintenance Symbols Legend

Note: The following symbols have been used in this manual to help communicate the intent of the instructions. When one or more of the symbols appears at the beginning of a maintenance procedure, it conveys the meaning below.

- Indicates that tools will be required to perform this procedure.
- Indicates that new parts will be required to perform this procedure.
- Indicates that a cold motor or pump will be required to perform this procedure.
- Indicates that dealer service will be required to perform this procedure.

Pre-delivery Preparation Report

The pre-delivery preparation report contains checklists for each type of scheduled inspection.

Make copies of the Pre-delivery Preparation report to use for each inspection. Store completed forms as required.

Maintenance Schedule

There are five types of maintenance inspections that must be performed according to a schedule—daily, quarterly, semi-annually, annually, and two year. The Scheduled Maintenance Procedures Section and the Maintenance Inspection Report have been divided into five subsections—A, B, C, D, and E. Use the following chart to determine which group(s) of procedures are required to perform a scheduled inspection.

<table>
<thead>
<tr>
<th>Inspection</th>

<tr>
<td>Semi-annually or every 500 hours</td>
<td>A + B + C</td>
</tr>
<tr>
<td>Annually or every 1000 hours</td>
<td>A + B + C + D</td>
</tr>
<tr>
<td>Two year or every 2000 hours</td>
<td>A + B + C + D + E</td>
</tr>
</tbody>
</table>

Maintenance Inspection Report

The maintenance inspection report contains checklists for each type of scheduled inspection.

Make copies of the Maintenance Inspection Report to use for each inspection. Maintain completed forms for a minimum of 4 years or in compliance with employer, jobsite and governmental regulations and requirements.
Pre-Delivery Preparation

Fundamentals

It is the responsibility of the dealer to perform the Pre-delivery Preparation.

The Pre-delivery Preparation is performed prior to each delivery. The inspection is designed to discover if anything is apparently wrong with a machine before it is put into service.

A damaged or modified machine must never be used. If damage or any variation from factory delivered condition is discovered, the machine must be tagged and removed from service.

Repairs to the machine may only be made by a qualified service technician, according to the manufacturer’s specifications.

Scheduled maintenance inspections shall be performed by qualified service technicians, according to the manufacturer’s specifications and the requirements listed in the responsibilities manual.

Instructions

Use the operator’s manual on your machine.

The Pre-delivery Preparation consists of completing the Pre-operation Inspection, the Maintenance items and the Function Tests.

Use this form to record the results. Place a check in the appropriate box after each part is completed. Follow the instructions in the operator’s manual.

If any inspection receives an N, remove the machine from service, repair and re-inspect it. After repair, place a check in the R box.

Legend

Y = yes, completed
N = no, unable to complete
R = repaired

### Instructions

- Make copies of this report to use for each inspection.
- Select the appropriate checklist(s) for the type of inspection to be performed.

### Daily or 8 hours Inspection:

- Place a check in the appropriate box after each inspection procedure is completed.
- Use the step-by-step procedures in this section to learn how to perform these inspections.
- If any inspection receives an “N”, tag and remove the machine from service, repair and re-inspect it. After repair, place a check in the “R” box.

### Legend

- Y = yes, acceptable
- N = no, remove from service
- R = repaired

Part No. 84700

GR • QSR • QSW
A-1
Inspect the Manuals and Decals

Maintaining the operator’s and safety manuals in good condition is essential to safe machine operation. Manuals are included with each machine and should be stored in the container provided in the platform. An illegible or missing manual will not provide safety and operational information necessary for a safe operating condition.

In addition, maintaining all of the safety and instructional decals in good condition is mandatory for safe machine operation. Decals alert operators and personnel to the many possible hazards associated with using this machine. They also provide users with operation and maintenance information. An illegible decal will fail to alert personnel of a procedure or hazard and could result in unsafe operating conditions.

1 Check to make sure that the operator’s and safety manuals are present and complete in the storage container on the platform.

2 Examine the pages of each manual to be sure that they are legible and in good condition.

○ Result: The operator’s manual is appropriate for the machine and all manuals are legible and in good condition.

◆ Result: The operator’s manual is not appropriate for the machine or all manuals are not in good condition or is illegible. Remove the machine from service until the manual is replaced.

3 Open the operator’s manual to the decals inspection section. Carefully and thoroughly inspect all decals on the machine for legibility and damage.

○ Result: The machine is equipped with all required decals, and all decals are legible and in good condition.

◆ Result: The machine is not equipped with all required decals, or one or more decals are illegible or in poor condition. Remove the machine from service until the decals are replaced.

4 Always return the manuals to the storage container after use.

Note: Contact your authorized Genie distributor or Genie Industries if replacement manuals or decals are needed.
A-2
Perform Pre-operation Inspection

Completing a Pre-operation Inspection is essential to safe machine operation. The Pre-operation Inspection is a visual inspection performed by the operator prior to each work shift. The inspection is designed to discover if anything is apparently wrong with a machine before the operator performs the function tests. The Pre-operation Inspection also serves to determine if routine maintenance procedures are required.

Complete information to perform this procedure is available in the appropriate operator's manual. Refer to the Operator's Manual on your machine.

A-3
Perform Function Tests

Completing the function tests is essential to safe machine operation. Function tests are designed to discover any malfunctions before the machine is put into service. A malfunctioning machine must never be used. If malfunctions are discovered, the machine must be tagged and removed from service.

Complete information to perform this procedure is available in the appropriate operator's manual. Refer to the Operator's Manual on your machine.
A-4
Test the Obstruction Sensing System (QSR models only)

Genie specifications require that this procedure be performed every 8 hours or daily, whichever comes first.

1. Raise the platform approximately 4 feet / 1.2 m.
2. Place a 15 lb / 6.8 kg weight onto one of the obstruction sensing pads, of an area equal to 3 inches / 7.3 cm in diameter.

Note: The weight must be placed approximately 2 inches / 5.08 cm from the edge of the obstruction sensing pad.

3. At the ground controls, attempt to lower the platform.
   □ Result: The obstruction sensing alarm sounds and the platform will not lower. The system is working properly.
   ☠ Result: The obstruction sensing alarm does not sound and the platform will lower. The system is not functioning correctly. Replace the pad. Refer to Repair procedure 12-1, How to Replace an Obstruction Sensing Pad.

4. Remove the the weight from the pad. Push in the red Emergency Stop button to the off position at the ground controls, then pull out the red Emergency Stop button to the on position at the ground controls.

5. Repeat the procedure, beginning with step 2, for each of the remaining obstruction sensing pads.
A-5
Perform 30 Day Service

The 30 day maintenance procedure is a one time procedure to be performed after the first 30 days or 40 hours of usage. After this interval, refer to the maintenance tables for continued scheduled maintenance.

1 Perform the following maintenance procedures:
   - B-3 Inspect the Tires and Wheels (including castle nut torque)
   - D-4 Replace the Hydraulic Tank Return Filter

A-6
Grease the Steer Yokes

Genie specifications require that this procedure be performed every 100 hours of operation.

Regular application of lubrication to the steer yokes is essential to good machine performance and service life. Continued use of an insufficiently greased steer yoke will result in component damage.

1 Locate the grease fitting on the top of the steer yoke.

2 Pump multipurpose grease into the steer yoke until the steer yoke is full and grease is being forced past the bearings. Repeat this step for the other steer yoke.

Grease Specification

Chevron Ultra-duty grease, EP NLGI 1 (lithium based) or equivalent
Checklist B Procedures

B-1
Inspect the Batteries

⚠️ ⚠️
Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper battery condition is essential to good machine performance and operational safety. Improper fluid levels or damaged cables and connections can result in component damage and hazardous conditions.

⚠️ ⚠️
Electrocution/burn hazard. Contact with hot or live circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

⚠️ ⚠️
Bodily injury hazard. Batteries contain acid. Avoid spilling or contacting battery acid. Neutralize battery acid spills with baking soda and water.

1 Put on protective clothing and eye wear.

2 **GR-12:** Raise the platform approximately 3 feet / 1 m.
   **GR-15 and GR-20:** Raise the platform approximately 5 feet / 1.5 m.

3 Open the battery cover. Rest the cover against the chassis.

4 Lower the platform until the mast just contacts the battery cover.

5 Be sure that the battery cable connections are free of corrosion.

Note: Adding terminal protectors and a corrosion preventative sealant will help eliminate corrosion on the battery terminals and cables.

6 Be sure that the battery hold downs and cable connections are tight.

7 Be sure that the battery separator wire connections are tight (if equipped).

8 Fully charge the batteries. Allow the batteries to rest 24 hours before performing this procedure to allow the battery cells to equalize.

9 Put on protective clothing and eye wear.

**Models without maintenance-free or sealed batteries:**

10 Remove the battery vent caps and check the specific gravity of each battery cell with a hydrometer. Note the results.
11 Check the ambient air temperature and adjust the specific gravity reading for each cell as follows:

- Add 0.004 to the reading of each cell for every 10° / 5.5° C above 80° F / 26.7° C.
- Subtract 0.004 from the reading of each cell for every 10° / 5.5° C below 80° F / 26.7° C.

☐ Result: All battery cells display an adjusted specific gravity of 1.277 or higher. The battery is fully charged. Proceed to step 15.

☒ Result: One or more battery cells display a specific gravity of 1.217 or below. Proceed to step 12.

12 Perform an equalizing charge OR fully charge the batteries and allow the batteries to rest at least 6 hours.

13 Remove the battery vent caps and check the specific gravity of each battery cell with a hydrometer. Note the results.

14 Check the ambient air temperature and adjust the specific gravity reading for each cell as follows:

- Add 0.004 to the reading of each cell for every 10° / 5.5° C above 80° F / 26.7° C.
- Subtract 0.004 from the reading of each cell for every 10° / 5.5° C below 80° F / 26.7° C.

☐ Result: All battery cells display a specific gravity of 1.277 or greater. The battery is fully charged. Proceed to step 15.

☒ Result: The difference in specific gravity readings between cells is greater than 0.1 OR the specific gravity of one or more cells is less than 1.177. Replace the battery.

15 Check the battery acid level. If needed, replenish with distilled water to 1/8 inch / 3 mm below the bottom of the battery fill tube. Do not overfill.

16 Install the vent caps and neutralize any electrolyte that may have spilled.

All models:

17 Check each battery pack and verify that the batteries are wired correctly.

18 Inspect the battery charger plug and pigtail for damage or excessive insulation wear. Replace as required.

19 Connect the battery charger to a properly grounded 115V/60Hz or 230V/60Hz single phase AC power supply.

☐ Result: The charger should operate and begin charging the batteries.

☒ If, simultaneously, the charger alarm sounds and the LEDs blink one time, correct the charger connections at the fuse and battery. The charger will then operate correctly and begin charging the batteries.

If, simultaneously, the charger alarm sounds and the LEDs blink two times, the input voltage is too low or too high. Correct the voltage issue. The charger will then operate correctly and begin charging the batteries.

If, simultaneously, the charger alarm sounds and the LEDs blink three times, the charger is overheated. Allow the charger to cool. The charger will then operate correctly and begin charging the batteries.

Note: For best results, use an extension of adequate size with a length no longer than 50 feet / 15 m.

Note: If you have any further questions regarding the battery charger operation, please contact the Genie Industries Scissor Service Department.
B-2

Inspect the Electrical Wiring

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Maintaining electrical wiring in good condition is essential to safe operation and good machine performance. Failure to find and replace burnt, chafed, corroded or pinched wires could result in unsafe operating conditions and may cause component damage.

**WARNING**

Electrocution/burn hazard. Contact with hot or live circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

1. Inspect the underside of the chassis for damaged or missing ground straps.
2. Inspect the following areas for burnt, chafed, corroded and loose wires:
   - Mast cable
   - Platform controls
   - Power to platform wiring
3. Inspect the following areas for burnt, chafed, corroded and loose wires:
   - Ground control panel
   - Hydraulic power unit
4. Inspect for a liberal coating of dielectric grease in all wiring connections between the ECM and the platform controls, and level sensor wiring.
5. Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
6. Raise the platform approximately 8 feet / 2.4 m from the ground.
7. Place a lifting strap from an overhead crane under the platform. Support the platform. Do not apply any lifting pressure.

**NOTICE**

Component damage hazard. The platform railings can be damaged if they are used to lift the platform. Do not attach the lifting strap to the platform railings.

8. Inspect the center chassis area for burnt, chafed and pinched cables.
9. Open the battery tray cover.
10. Inspect the battery tray for burnt, chafed and pinched cables.
11. Close the battery tray cover.
12. Remove the strap from the platform.
13. Lower the platform to the stowed position and turn the machine off.
B-3
Inspect the Tires and Wheels (including castle nut torque)

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Maintaining the tires and wheels in good condition is essential to safe operation and good performance. Tire and/or wheel failure could result in a machine tip-over. Component damage may also result if problems are not discovered and repaired in a timely fashion.

1. Check the tire surface and sidewalls for cuts, cracks, punctures and unusual wear.
2. Check each wheel for damage, bends and cracks.
3. Remove the cotter pin and check each castle nut for proper torque. Refer to Section 2, Specifications.
   Note: Always replace the cotter pin with a new one when removing the castle nut or when checking the torque of the castle nut.
4. Install a new cotter pin. Bend the cotter pin to lock it in place.

B-4
Check the Lifting Chain Adjustments

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Maintaining proper adjustment of the lifting chains is essential to safe machine operation. Failure to maintain proper chain adjustment could result in an unsafe operating condition and may cause component damage.

1. Fully lower the platform and measure the maximum height of the machine.
   - Result: The machine is within specification. Refer to Section 2, Specifications.
   - Result: The machine is not within specification. Adjust the chains. Refer to Repair procedure 3-3, How to Adjust the Lifting Chains.
B-5
Clean and Lubricate the Columns

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Clean and properly lubricated columns are essential to good machine performance and safe operation. Extremely dirty conditions may require that the columns be cleaned and lubricated more often.

1. Raise the platform to the maximum height.
2. Place a lifting strap from an overhead crane under the platform. Support the platform. Do not apply any lifting pressure.

   **NOTICE** Component damage hazard. The platform railings can be damaged if they are used to lift the platform. Do not attach the lifting strap to the platform railings.

3. Visually inspect the inner and outer channels of the columns for debris or foreign material. If necessary, use a mild cleaning solvent to clean the columns.

   **WARNING** Bodily injury hazard. This procedure will require the use of additional access equipment. Do not place ladders or scaffold on or against any part of the machine. Performing this procedure without the proper skills and tools could result in death or serious injury. Dealer service is strongly recommended.

4. If needed, apply a generous amount of Boe-lube wax to the inside and outside channels of each column.

B-6
Adjust the Sequencing Cables

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Maintaining proper adjustment of the sequencing cables is essential for safe machine operation. An unsafe working condition exists if the sequencing cables are improperly adjusted. A frequent check allows the inspector to identify changes in the sequencing cables operating condition that might indicate damage.

1. Fully lower the platform.
2. Locate the compression spring on each sequencing cable.

   **Note:** The spring is located between the nylock nut and the upper sequencing bracket.
3 Confirm proper tension of each sequencing cable by measuring the height of the spring between the nylock nut and the upper sequencing bracket.

☐ Result: The measurement is within specification. Proceed to step 7.

☒ Result: The measurement is not within specification. Proceed to step 4.

Sequencing cable spring specification

| Measurement, compressed | \( \frac{15}{16} \) inch 2.4 cm |

4 Adjust the spring compressed length by turning the nylock nut clockwise to decrease the spring length or counterclockwise to increase the spring length.

Component damage hazard. Do not compress the spring to less than specification.

5 Raise and lower the platform through three complete cycles.

6 Repeat this procedure beginning with step 3.

7 Repeat steps 3 through 5 for each sequencing cable as required.

B-7

Test the Emergency Stop

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

A properly functioning Emergency Stop is essential for safe machine operation. An improperly operating red Emergency Stop button will fail to shut off power and stop all machine functions, resulting in a hazardous situation.

Note: As a safety feature, selecting and operating the ground controls will override the platform controls, except the platform red Emergency Stop button.

1 Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

2 Push in the red Emergency Stop button at the ground controls to the off position.

☒ Result: No machine functions should operate.

3 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

4 Push down the red Emergency Stop button at the platform controls to the off position.

☐ Result: No machine functions should operate.

Note: The red Emergency Stop button at the ground controls will stop all machine operation, even if the key switch is switched to platform control.
CHECKLIST B PROCEDURES

B-8 Test the Key Switch

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper key switch action and response is essential to safe machine operation. The machine can be operated from the ground or platform controls and the activation of one or the other is accomplished with the key switch. Failure of the key switch to activate the appropriate control panel could cause a hazardous operating situation.

Note: Perform this procedure from the ground using the platform controls. Do not stand in the platform.

1. Pull out the red Emergency Stop button to the on position at both the ground and platform controls.
2. Turn the key switch to platform control.
3. Check the platform up/down function from the ground controls.
   ☑ Result: The machine functions should not operate.
4. Turn the key switch to ground control.
5. Check the machine functions from the platform controls.
   ☑ Result: The machine functions should not operate.
6. Turn the key switch to the off position.
7. Test the machine functions from the ground and platform controls.
   ☑ Result: No machine functions should operate.

B-9 Test the Automotive-style Horn (if equipped)

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

The horn is activated at the platform controls and sounds at the ground as a warning to ground personnel. An improperly functioning horn will prevent the operator from alerting ground personnel of hazards or unsafe conditions.

1. Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
2. Push down the horn button at the platform controls.
   ☑ Result: The horn should sound.
B-10
Inspect the Voltage Inverter (if equipped)

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

The inverter is activated whenever the power is on, and an electrical tool is connected to the inverter and turned on.

1. Inspect the inverter plug and pigtail for damage or excessive insulation wear. Replace as required.

2. Turn the key switch to the on position and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

3. Connect an appropriate power tool to the inverter. Activate the tool.

Result: The power tool should operate. There may be a brief (0.5 second) delay if the power tool has not been used in the previous 10 minutes.

If the left fault LED (REV_POL) is illuminated, the inverter is connected to batteries with the incorrect polarity. Correct the polarity issue with the red wire to battery positive and the black wire to battery negative. The inverter will then operate correctly and begin supplying AC power.

If the right fault LED (123) blinks one time, the power draw is too high. The tool being used requires too much power to operate or is being used at or near the limit of the inverter for an extended period of time. Reduce the power draw. The inverter will then operate correctly and begin supplying AC power.

If the right fault LED (123) blinks two times, the Ground Fault Interrupt (GFI) has been activated. A short circuit or partial short exists between the AC hot and ground in the tool or outlet. Check the tool for burnt, chafed, corroded and loose wires, and inspect the tool for internal moisture. Correct the short circuit or moisture issue OR inspect the wiring in the power-to-platform box. The inverter will then operate correctly and begin supplying AC power.

If right fault LED (123) blinks three times, the inverter is overheated. Allow the inverter to cool. The inverter will then operate correctly and begin supplying AC power.

If the battery 25 volt fault LED (25V) blinks one time, the battery voltage is over 30V. Operate the machine to lower the voltage level. The inverter will then operate correctly and begin supplying AC power.

If the battery 21 volt fault LED (21V) blinks one time, the battery voltage is less than 20V DC. The inverter will continue to operate until the battery voltage falls to 17.8V DC.
B-11
Test the Drive Brakes

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper brake action is essential to safe machine operation. The drive brake function should operate smoothly, free of hesitation, jerking and unusual noise. Hydraulically-released individual wheel brakes can appear to operate normally when not fully operational.

Note: Perform this procedure with the machine on a firm, level surface that is free of obstructions.

Note: Be sure the platform extension deck is fully retracted and the platform is in the stowed position.

1 Mark a test line on the ground for reference.
2 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
3 Lower the platform to the stowed position.
4 Press the drive function select button.
5 Choose a point on the machine; i.e., contact patch of a tire, as a visual reference for use when crossing the test line.
6 Bring the machine to top drive speed before reaching the test line. Release the function enable switch or the joystick when your reference point on the machine crosses the test line.
7 Measure the distance between the test line and your machine reference point. Refer to Section 2, Specifications.

Note: The brakes must be able to hold the machine on any slope it is able to climb.
B-12
Test the Drive Speed - Stowed Position

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper drive functions are essential to safe machine operation. The drive function should respond quickly and smoothly to operator control. Drive performance should also be free of hesitation, jerking and unusual noise over the entire proportionally controlled speed range.

Note: Perform this procedure with the machine on a firm, level surface that is free of obstructions.

1 Create start and finish lines by marking two lines on the ground 40 feet / 12.2 m apart.
2 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
3 Lower the platform to the stowed position.
4 Press the drive function select button.
5 Choose a point on the machine; i.e., contact patch of a tire, as a visual reference for use when crossing the start and finish lines.
6 Bring the machine to top drive speed before reaching the start line. Begin timing when your reference point on the machine crosses the start line.
7 Continue at full speed and note the time when your reference point on the machine passes over the finish line. Refer to Section 2, Specifications.
B-13
Test the Drive Speed - Raised Position

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper drive functions are essential to safe machine operation. The drive function should respond quickly and smoothly to operator control. Drive performance should also be free of hesitation, jerking and unusual noise over the entire proportionally controlled speed range.

Note: Perform this procedure with the machine on a firm, level surface that is free of obstructions.

1 Create start and finish lines by marking two lines on the ground 40 feet / 12.2 m apart.

2 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

3 Press the lift function select button.

4 Press and hold the function enable switch on the joystick.

5 Raise the platform approximately 4 feet / 1.2 m from the ground.

6 Press the drive function select button.

7 Choose a point on the machine; i.e., contact patch of a tire, as a visual reference for use when crossing the start and finish lines.

8 Bring the machine to top drive speed before reaching the start line. Begin timing when your reference point on the machine crosses the start line.

9 Continue at full speed and note the time when your reference point on the machine passes over the finish line. Refer to Section 2, Specifications.
B-14
Test the Slow Drive Speed

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Proper drive functions are essential to safe machine operation. The drive function should respond quickly and smoothly to operator control. Drive performance should also be free of hesitation, jerking and unusual noise over the entire proportionally controlled speed range.

Note: Perform this procedure with the machine on a firm, level surface that is free of obstructions.

1. Create start and finish lines by marking two lines on the ground 40 feet / 12.2 m apart.

2. Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

3. Lower the platform to the stowed position.

4. Press the slow speed select button.

5. Choose a point on the machine; i.e., contact patch of a tire, as a visual reference for use when crossing the start and finish lines.

6. Bring the machine to top drive speed before reaching the start line. Begin timing when your reference point on the machine crosses the start line.

7. Continue at full speed and note the time when your reference point on the machine passes over the finish line. Refer to Section 2, Specifications.
CHECKLIST B PROCEDURES

B-15
Test the Motion Alarm (if equipped)

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Alarms are used to alert operators and ground personnel of machine proximity and motion. The motion alarm is located in the ground control box and, when activated, will sound at 60 beeps per minute.

1. Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
2. Raise the platform approximately 1 foot / 0.3 m.
   ○ Result: When raising the platform, the motion alarm should sound.
3. Lower the platform to the stowed position.
   ○ Result: When lowering the platform, the motion alarm should sound.
4. Turn the key switch to platform controls.
5. Press the lift function select button.
6. Press and hold the function enable switch on the joystick. Move the joystick off center, hold for a moment and then release it. Move the joystick off center in the opposite direction, hold for a moment and then release it.
   ○ Result: The motion alarm should sound when the joystick is moved off center in either direction.
7. Press the drive function select switch.
8. Press and hold the function enable switch on the joystick. Move the joystick off center, hold for a moment and then release it. Move the joystick off center in the opposite direction, hold for a moment and then release it.
   ○ Result: The motion alarm should sound when the joystick is moved off center in either direction.
9. Press and hold the function enable switch on the joystick. Press and hold the thumb rocker switch for a moment to the left position and then release it. Press and hold the thumb rocker switch for a moment to the right position and then release it.
   ○ Result: The motion alarm should sound when the rocker switch is moved off center in either direction.
B-16
Test the Flashing Beacons
(if equipped)

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Flashing beacons are used to alert operators and ground personnel of machine proximity and motion. The flashing beacons are located on both sides of the mast.

1. Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
   - Result: The beacons should flash.

2. Turn the key switch to platform controls.
   - Result: The beacons should flash.

B-17
Perform Hydraulic Oil Analysis

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

Replacement or testing of the hydraulic oil is essential for good machine performance and service life. Dirty oil may cause the machine to perform poorly and continued use may cause component damage. Extremely dirty conditions may require oil changes to be performed more often.

Before replacing the hydraulic oil, the oil may be tested by an oil distributor for specific levels of contamination to verify that changing the oil is necessary. **If the hydraulic oil is not replaced at the two year inspection, test the oil quarterly. Replace the oil when it fails the test.** See E-1, *Test or Replace the Hydraulic Oil.*
B-18
Inspect the Breather Cap

Genie specifications require that this procedure be performed every 250 hours or quarterly, whichever comes first.

A free-breathing hydraulic tank cap is essential for good machine performance and service life. A dirty or clogged cap may cause the machine to perform poorly. Extremely dirty conditions may require that the cap be inspected more often.

1 Remove the breather cap from the hydraulic tank.
2 Check for proper venting.
   ☒ Result: Air passes through the breather cap.
   ☒☒ Result: If air does not pass through the cap, clean or replace the cap. Proceed to step 3.

Note: When checking for positive tank cap venting, air should pass freely through the cap.

3 Using a mild solvent, carefully wash the cap venting system. Dry using low pressure compressed air. Repeat step 2.
4 Install the breather cap onto the hydraulic tank.

Checklist C Procedures

C-1
Grease the Platform Overload Mechanism (if equipped)

Genie specifications require that this procedure be performed every 500 hours or 6 months, whichever comes first. Perform this procedure more often if dusty conditions exist.

Application of lubrication to the platform overload mechanism is essential to safe machine operation. Continued use of an improperly greased platform overload mechanism could result in the system not sensing an overloaded platform condition and will result in component damage.

1 Locate the grease fittings on each pivot pin of the platform overload assembly.

2 Thoroughly pump grease into each grease fitting using a multi-purpose grease.

C-2
Replace the Hydraulic Tank Breather Cap - Models with Optional Hydraulic Oil

Genie specifications require that this procedure be performed every 500 hours or six months, whichever comes first OR when the machine fails to lift the maximum rated load.

The hydraulic tank is a vented-type tank. The breather cap has an internal air filter that can become clogged or, over time, can deteriorate. If the breather cap is faulty or improperly installed, impurities can enter the hydraulic system which may cause component damage. Extremely dirty conditions may require that the cap be inspected more often.

1 Remove and discard the hydraulic tank breather cap.

2 Install a new cap onto the tank.
C-3
Test the Platform Overload System (if equipped)

Genie specifications require that this procedure be performed every 500 hours or 6 months, whichever comes first.

Testing the platform overload system regularly is essential to safe machine operation. Continued use of an improperly operating platform overload system could result in the system not sensing an overloaded platform condition. Machine stability could be compromised resulting in the machine tipping over.

Note: Perform this procedure with the machine on a firm, level surface.

1. Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
2. Determine the maximum platform capacity. Refer to the machine serial plate.
3. Using a suitable lifting device, place an appropriate test weight equal to the maximum platform capacity in the center of the platform floor.
   ● Result: The diagnostic display at the ground controls will show two flat bars and a blinking light, indicating a normal condition, and the diagnostic display at the platform controls will show the battery condition. Refer to Repair procedure 1-3, How to Determine the Battery Voltage.
   ● Result: The diagnostic display will show ‘OL’ at both the ground and platform controls. The platform overload system is not operating properly. Refer to Repair Procedure 11-1, Calibrate the Platform Overload System (if equipped).
4. Add an additional weight to the platform not to exceed 20% of the maximum rated load. Refer to the machine serial plate.
   ● Result: The diagnostic display will show ‘OL’ at both the ground and platform controls. The platform overload system is operating properly.
   ● Result: The diagnostic display at the ground controls will show two flat bars and a blinking light and the diagnostic display at the platform controls will show the battery condition. The platform overload system is not operating properly. Refer to Repair Procedure 11-1, Calibrate the Platform Overload System (if equipped).
5. Test all machine functions from the platform controls.
   ● Result: All platform control functions should not operate.
6 Turn the key switch to ground control.

7 Test all machine functions from the ground controls.

☐ Result: All ground control functions should not operate.

8 Lift the test weight off the platform floor using a suitable lifting device. Turn the key switch to the off position.

9 Turn the key switch to ground control.

☐ Result: The diagnostic display at the ground controls will show two flat bars and a blinking light, indicating a normal condition, and the diagnostic display at the platform controls will show the battery condition.

☒ Result: The diagnostic display will show ‘OL’ at both the ground and platform controls. The platform overload system is not operating properly. Refer to Repair Procedure 11-1, *Calibrate the Platform Overload System (if equipped)*.

10 Test all machine functions from the ground controls.

☐ Result: All ground control functions should operate normally.

11 Turn the key switch to platform control.

12 Test all machine functions from the platform controls.

☐ Result: All platform control functions should operate.

Note: If the platform overload system is not operating properly, refer to Repair Procedure 11-1, *Calibrate the Platform Overload System (if equipped)*.
Checklist D Procedures

D-1
Inspect the Mast Assembly for Wear

Genie specifications require that this procedure be performed every 1000 hours or annually, whichever comes first.

Detection of excessive or unusual wear in the mast assembly is essential for safe machine operation. An unsafe working condition exists if the mast assembly has excessive wear and/or does not operate smoothly, free of hesitation and binding.

1. Remove the mast covers.

2. Raise the platform until approximately 4 inches / 10 cm of each column is visible.

3. GR-12 and GR-15: Visually inspect the top of each column for clearance between the roller wheels and the adjacent column surface. GR-20: Visually inspect the top of each column for clearance between the slider block and the adjacent column surface.

   - Result: There should be an equal amount of distance between the roller wheel/slider block and the column on each side.

4. Loosen but do not remove the adjustment nut on the sequencing cable located at the top of the first column.

5. Raise the platform approximately 3 feet / 1 m above the top of the drive chassis.

6. Place a jack stand on the top of the battery cover, centered under the platform. Adjust the jack stand height to 24 inches / 60 cm.

7. Lower the platform onto the jack stand just enough to take the weight off the lifting chains.

   **WARNING** Crushing hazard. Keep hands clear of the jack stand when lowering the platform.

---

a mast cover
b idler wheel
c spacer
Section 3 • Scheduled Maintenance Procedures

8 Inspect each idler wheel for the following:
   · Excessive wear on the side flanges
   · Unusual wear
   · Movement side to side in excess of 0.040 inch / 1 mm
   · Any wheel movement front to back

Note: If idler wheel inspection results in a condition that is not within specification, refer to Repair procedure 3-1, How to Assemble the Mast.

9 GR-20: Inspect each wear pad for the following:
   · Excessive or unusual wear

Note: If a wear pad displays excessive or unusual wear, refer to Repair procedure 3-1, How to Assemble the Mast.

10 Raise the platform slightly and remove the jack stand. Lower the platform to the stowed position.

11 Install the mast covers and adjust the sequencing cable. See B-6, Adjust the Sequencing Cables.

D-2
Inspect and Lubricate the Lifting Chains

Genie specifications require that this procedure be performed every 1000 hours or annually, whichever comes first.

Lubricated chains are essential to good machine performance and safe operation. Extremely dirty conditions may require that the chains be cleaned and lubricated more often.

1 Thoroughly inspect the lifting chains. Refer to Repair Procedure 3-3, How to Inspect the Lifting Chains.

2 Raise the platform to the maximum height.

3 Place a lifting strap from an overhead crane under the platform. Support the platform. Do not apply any lifting pressure.

Component damage hazard. The platform railings can be damaged if they are used to lift the platform. Do not attach the lifting strap to the platform railings.

4 Lubricate each chain with a dry-type spray lubricant.

Bodily injury hazard. This procedure will require the use of additional access equipment. Do not place ladders or scaffold on or against any part of the machine. Performing this procedure without the proper skills and tools could result in death or serious injury. Dealer service is strongly recommended.
D-3
Replace the
Hydraulic Tank Return Filter

Genie specifications require that this procedure be performed every 1000 hours or annually, whichever comes first.

Replacement of the hydraulic tank return filter is essential for good machine performance and service life. A dirty or clogged filter may cause the machine to perform poorly and continued use may cause component damage. Extremely dirty conditions may require that the filter be replaced more often.

⚠️ CAUTION  Burn hazard. Beware of hot oil. Contact with hot oil may cause severe burns.

Note: The hydraulic tank return filter is mounted on the function manifold next to the hydraulic power unit.

1. Clean the area around the oil filter. Remove the filter with an oil filter wrench.

2. Apply a thin layer of oil to the new oil filter gasket.

3. Install the new filter and tighten it securely by hand.

4. Use a permanent ink marker to write the date and number of hours from the hour meter onto the filter.

5. Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

6. Activate and hold the platform up toggle switch.

7. Inspect the filter and related components to be sure that there are no leaks.

8. Clean up any oil that may have spilled.

Checklist E Procedure

E-1
Test or Replace the Hydraulic Oil

Genie specifications require that this procedure be performed every 2000 hours or every two years, whichever comes first.

Replacement or testing of the hydraulic oil is essential for good machine performance and service life. Dirty oil may cause the machine to perform poorly and continued use may cause component damage. Extremely dirty conditions may require oil changes to be performed more often.

Note: Before replacing the hydraulic oil, the oil may be tested by an oil distributor for specific levels of contamination to verify that changing the oil is necessary. **If the hydraulic oil is not replaced at the two year inspection, test the oil quarterly.**

Replace the oil when it fails the test.

Note: Perform this procedure with the platform in the stowed position.

1 Disconnect the battery pack from the machine.

**WARNING** Electrocution/burn hazard. Contact with hot or live circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

2 Open the power unit module tray.

3 Tag and disconnect the hydraulic tank return hard line from the hydraulic filter head and remove the hard line from the tank. Cap the fitting on the filter head.

4 Tag and disconnect the hydraulic pump inlet hard line and remove the hard line from the tank. Cap the fitting on the pump.

5 Remove the hydraulic tank retaining fasteners and remove the hydraulic tank from the machine.

6 Drain all of the oil into a suitable container. Refer to Section 2, Specifications, for capacity information.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

7 Clean up any oil that may have spilled. Properly discard the used oil.

8 Clean the inside of the hydraulic tank using a mild solvent. Allow the tank to dry completely.

9 Install the hydraulic tank and install and tighten the hydraulic tank retaining fasteners. Torque to specification.

Part No. 84700

GR • QSR • QSW

3 - 31
CHECKLIST E PROCEDURE

10 Install the hydraulic pump inlet hard line into the tank. Install the fitting onto the pump and torque to specification. Refer to Section 2, Specifications.

11 Install the hydraulic pump return hard line into the tank. Install the fitting onto the hydraulic filter head and torque to specification. Refer to Section 2, Specifications.

12 Fill the tank with hydraulic oil until the fluid is at the FULL indicator on the hydraulic tank. Do not overfill.

13 Activate the pump to fill the hydraulic system with oil and bleed the system of air.

**NOTICE** Component damage hazard. The pump can be damaged if operated without oil. Be careful not to empty the hydraulic tank while in the process of filling the hydraulic system. Do not allow the pump to cavitate.

14 Repeat steps 12 through 13 until the hydraulic system and tank are both full.
Repair Procedures

Observe and Obey:

- Repair procedures shall be completed by a person trained and qualified on the repair of this machine.
- Immediately tag and remove from service a damaged or malfunctioning machine.
- Repair any machine damage or malfunction before operating the machine.

Before Repairs Start:

- Read, understand and obey the safety rules and operating instructions in the appropriate operator’s manual on your machine.
- Be sure that all necessary tools and parts are available and ready for use.
- Use only Genie approved replacement parts.
- Read each procedure completely and adhere to the instructions. Attempting shortcuts may produce hazardous conditions.
- Unless otherwise specified, perform each repair procedure with the machine in the following configuration:
  - Machine parked on a firm, level surface
  - Platform in the stowed position
  - Key switch in the off position with the key removed
  - The red Emergency Stop button in the off position at both ground and platform controls
  - Wheels chocked
  - All external AC power supply disconnected from the machine

About This Section

Most of the procedures in this section should only be performed by a trained service professional in a suitably equipped workshop. Select the appropriate repair procedure after troubleshooting the problem.

Perform disassembly procedures to the point where repairs can be completed. Then to reassemble, perform the disassembly steps in reverse order.

Symbols Legend

- Safety alert symbol—used to alert personnel to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.
- Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
- Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
- Indicates a potentially hazardous situation which, if not avoided, may cause minor or moderate injury.
- Indicates a potentially hazardous situation which, if not avoided, may result in property damage.
- Indicates that a specific result is expected after performing a series of steps.
- Indicates that an incorrect result has occurred after performing a series of steps.
Platform Controls

The platform controls, used to operate the machine from the platform or while standing on the ground, can also be used to tune the performance of the machine.

Moving the joystick or activating a button sends a signal to the Electronic Control Module (ECM). When the ECM is in the function mode, the platform controls are used to operate the various machine functions. When the ECM is in the speed tuning mode (PS is shown in the diagnostic display window) or software configuration mode (SC is shown in the diagnostic display window), the platform controls are used to adjust the function speed parameters or the machine configuration.

The platform controls consist of an electronic circuit board, joystick, alarm, buttons and LEDs.

For further information or assistance, consult the Genie Industries Service Department.

1-1 Circuit Boards

How to Remove the Platform Controls Circuit Board

1. Push in the red Emergency Stop button to the off position at both the ground and platform controls.
2. Remove the retaining fasteners securing the bottom to the platform control box. Open the control box.
3. Remove the ties securing the wire harness.
4. Remove the alarm and red Emergency Stop button from the platform control box.
5. Carefully disconnect the three wire harness connectors from the platform controls circuit board.

**WARNING** Electrocuton/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

**NOTICE** Component damage hazard. Electrostatic discharge (ESD) can damage printed circuit board components. Maintain firm contact with a metal part of the machine that is grounded at all times when handling printed circuit boards OR use a grounded wrist strap.

6. Carefully remove the platform controls circuit board retaining fasteners.
7. Carefully remove the platform controls circuit board from the platform control box lid.
1-2
Controller Adjustments

Platform lift speed, stowed drive speed, raised drive speed and slow drive speed are adjustable to compensate for wear in the hydraulic pump and drive motors.

The function speeds are determined by the percentage of total controller output.

For further information or assistance, consult the Genie Industries Service Department.

**DANGER**

Tip-over hazard. Do not adjust the lift and/or drive speed higher than specified in this procedure. Setting the function speeds greater than specifications could cause the machine to tip over resulting in death or serious injury.

**DANGER**

Tip-over hazard. This procedure must only be performed by a trained service professional. Attempting this procedure without the necessary skills could result in death or serious injury.

Note: Select a test area that is firm, level and free of obstructions.

---

How to Determine the Software Revision Level

1. Remove the platform controls from the platform.
2. Place the platform controls close to the diagnostic display on the power unit side of the machine.
3. Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.
4. Press the lift function select button.
5. Slowly move the joystick in the direction indicated by the yellow arrow.
6. Push in the red Emergency Stop button to the off position at both the ground and platform controls and turn the key switch to the off position.
How to Adjust the Lift Speed

⚠️ DANGER ⚠️ Tip-over hazard. Do not adjust the lift and/or drive speed higher than specified in this procedure. Setting the function speeds greater than specifications could cause the machine to tip over resulting in death or serious injury.

⚠️ DANGER ⚠️ Tip-over hazard. This procedure must only be performed by a trained service professional. Attempting this procedure without the necessary skills will result in death or serious injury.

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and horn buttons and pull out the red Emergency Stop button to the on position.

Result: The diagnostic display will show “PS.”
5. Release the lift function select and horn buttons.
Result: The diagnostic display will show the maximum lift speed percentage.
6. Press the lift function select button.

7. Use the steering thumb rocker switch on the joystick to increase or decrease the maximum lift speed percentage. Refer to Section 2, Specifications, for function speeds.
8. Turn the key switch to the off position.

Note: Any change in software settings will not take effect until the key switch is turned to the off position.
How to Adjust the Stowed Drive Speed

⚠️ DANGER ⚠️ Tip-over hazard. Do not adjust the lift and/or drive speed higher than specified in this procedure. Setting the function speeds greater than specifications could cause the machine to tip over resulting in death or serious injury.

⚠️ DANGER ⚠️ Tip-over hazard. This procedure must only be performed by a trained service professional. Attempting this procedure without the necessary skills will result in death or serious injury.

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and horn buttons and pull out the red Emergency Stop button to the on position.
5. Release the lift function select and horn buttons.
6. Press the drive function select button.

Result: The diagnostic display will show "PS."
7. Use the steering thumb rocker switch on the joystick to increase or decrease the stowed drive speed percentage. Refer to Section 2, Specifications, for function speeds.
8. Turn the key switch to the off position.

Note: Any change in software settings will not take effect until the key switch is turned to the off position.
How to Adjust the Raised Drive Speed

⚠️ DANGER ⚠️ Tip-over hazard. Do not adjust the lift and/or drive speed higher than specified in this procedure. Setting the function speeds greater than specifications could cause the machine to tip over resulting in death or serious injury.

⚠️ DANGER ⚠️ Tip-over hazard. This procedure must only be performed by a trained service professional. Attempting this procedure without the necessary skills will result in death or serious injury.

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and horn buttons and pull out the red Emergency Stop button to the on position.

Result: The diagnostic display will show "PS."

5. Release the lift function select and horn buttons.

Result: The diagnostic display will show the maximum lift speed percentage.

6. Press the drive function select button.
7. Press and hold the horn button.

Result: The diagnostic display will show the raised drive speed percentage.
8. Use the steering thumb rocker switch on the joystick to increase or decrease the maximum lift speed percentage. Refer to Section 2, Specifications, for function speeds.
9. Turn the key switch to the off position.

Note: Any change in software settings will not take effect until the key switch is turned to the off position.
How to Adjust the Slow Drive Speed

**Tip-over hazard.** Do not adjust the lift and/or drive speed higher than specified in this procedure. Setting the function speeds greater than specifications could cause the machine to tip over resulting in death or serious injury.

**Tip-over hazard.** This procedure must only be performed by a trained service professional. Attempting this procedure without the necessary skills will result in death or serious injury.

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and horn buttons and pull out the red Emergency Stop button to the on position.

- **Result:** The diagnostic display will show “PS.”
5. Release the lift function select and horn buttons.

- **Result:** The diagnostic display will show the maximum lift speed percentage.
6. Press the drive function select button.

- **Result:** The diagnostic display will show the stowed drive speed percentage.
7. Press and hold the slow speed select button.

- **Result:** The diagnostic display will show the slow drive speed percentage.
8. Use the steering thumb rocker switch on the joystick to increase or decrease the stowed high torque drive speed percentage. Refer to Section 2, Specifications, for function speeds.
9. Turn the key switch to the off position.

Note: Any change in software settings will not take effect until the key switch is turned to the off position.
1-3
Software Configuration

The Electronic Control Module (ECM) contains programming for all configurations of the Genie Runabout. The machine can be adjusted to a different configuration using the buttons at the platform controls.

How to Determine the Software Configuration

1. Remove the platform controls from the platform.
2. Pull out the red Emergency Stop button to the on position at the ground controls.
3. Push in the red Emergency Stop button to the off position at the platform controls.
4. At the platform controls, press and hold the lift function select and speed select buttons, and pull out the red Emergency Stop button to the on position.

Result: The diagnostic display, at the platform controls and the ECM, will show "SC."

5. Release the lift function select and speed select buttons.

Result: The diagnostic display will show the current configuration.

6. Push in the red Emergency Stop button to the off position at both the ground and platform controls and turn the key switch to the off position.
How to Change the Software Configuration

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and speed select buttons, and pull out the red Emergency Stop button to the on position.
   - Result: The diagnostic display, at the platform controls and the ECM, will show "SC."
5. Release the lift function select and speed select buttons.
   - Result: The diagnostic display will show the current software configuration.
6. Press the lift function select button.
   - Result: The 'tens' digit setting will be activated and the current 'tens' setting will flash in the diagnostic display. Use the steering thumb rocker switch on the joystick to increase or decrease the value. See 1-3, Machine Configuration Code Chart for configuration settings.
7. Press and hold the lift function select button for a minimum of 3 seconds to set the 'tens' value.
8. Press the slow speed select button.
   - Result: The 'ones' digit setting will be activated and the current 'ones' setting will flash in the diagnostic display. Use the steering thumb rocker switch on the joystick to increase or decrease the value. See 1-3, Machine Configuration Code Chart for configuration settings.
9. Press and hold the slow speed select button for a minimum of 3 seconds or until the 'ones' setting stops flashing.
10. Turn the key switch to the off position.

Note: Any change in software settings will not take effect until the key switch is turned to the off position.
Machine Configuration Code

Machine Option / Feature Definitions

**Non-slab Option:** For the GR to function correctly, each model is configured with this option.

**Motion Alarm:** The motion alarm will sound when operating any function.

**Lift/Drive Cut Out:** In addition to an alarm sounding, lift and drive functions are disabled when the platform is raised above the down limit switch and the incline of the chassis exceeds the rating on the serial plate. Configured on all machines.

**Platform Overload:** When the platform overload limit switch is tripped, signaling an overload condition in the platform, all machine functions are disabled. The additional weight must be removed from the platform and the power cycled from off to on before any function can be resumed. Required for CE models.

**Battery Drain Alarm:** When the machine is turned on and in the stowed position, and no function is activated for 2 minutes, an alarm will sound once every 3 seconds. When this option is configured, a dot in the diagnostic display window will remain continuously illuminated when the ECM is in the ‘SC’ mode OR when the platform up function is activated.
How to Activate the Battery Drain Alarm Option

1. Pull out the red Emergency Stop button to the on position at the ground controls.
2. Push in the red Emergency Stop button to the off position at the platform controls.
3. Turn the key switch to platform control.
4. At the platform controls, press and hold the lift function select and speed select buttons, and pull out the red Emergency Stop button to the on position.
   - Result: The diagnostic display, at the platform controls and the ECM, will show "SC."
5. Release the lift function select and speed select buttons.
   - Result: The diagnostic display will show the current software configuration.
6. Press the slow speed select button.
   - Result: The 'ones' digit setting will be activated and the current 'ones' setting will flash in the diagnostic display.
7. Press the horn button.
   - Result: A dot, located at the lower right of the diagnostic display window, will become illuminated. This indicates that the battery drain alarm option has been activated.
8. Press and hold the speed select button for a minimum of 3 seconds or until the 'ones' setting stops flashing.
9. Turn the key switch to the off position.
   - Note: To deactivate the battery drain alarm option on a machine which has the option activated, repeat this procedure. When the ECM is in the ‘SC’ mode and the option is deactivated, there will not be an illuminated dot in the diagnostic display window.

How to Determine the Battery Voltage

The diagnostic display on the platform controls is used to indicate the battery voltage at all times when the machine is in normal operation.

Limp Mode: If the battery level falls to less than 17.8V DC, the single bar in the diagnostic display will be flashing and machine drive speed is limited to that of the raised drive speed. Refer to Section 2, Specifications.

- the battery level is 22.6V DC or higher
- the battery level is 21.6 to 22.5V DC
- the battery level is 20.7 to 21.5V DC
- the battery level is 19.7 to 20.6V DC
- the battery level is 17.8 to 19.6V DC
- the battery level is less than 17.8V DC
**Platform Components**

### 2-1 Platform

#### How to Remove the Platform

1. Raise the platform approximately 1 foot / 30 cm.
2. Place support blocks between the platform and the drive chassis. Lower the platform onto the blocks.

**WARNING** Crushing hazard. Keep hands clear when lowering the platform.

3. Turn the key switch to the off position and disconnect the battery pack from the machine.

**WARNING** Electrocution/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

4. Disconnect the platform controls from the control cable at the platform. Remove the platform controls from the platform and set the controls to the side.

5. Carefully cut the cable ties securing the control cable to the platform.

**NOTICE** Component damage hazard. The control cable can be damaged if cut while removing the cable ties.

6. Remove the fasteners securing the junction box bracket to the mast. Set the bracket and fasteners to the side.

3. Attach a lifting strap of suitable capacity from an overhead crane and center it around the platform railing. Support the platform. Do not apply any lifting pressure.

7. Remove the fasteners securing the platform mount to the mast and set the fasteners to the side. Remove the platform and mount from the machine.

**WARNING** Crushing hazard. The platform could become unbalanced and fall if not properly supported when removed from the machine.

### 2-2 Platform Extension

#### How to Remove the Platform Extension

1. Turn the key switch to the off position.
2. Disconnect the battery pack from the machine.

**WARNING** Electrocution/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

3. Disconnect the platform controls from the control cable at the platform, and remove the platform controls from the platform. Set the platform controls to the side.

4. Slide the extension deck forward until the holes at the front of the extension deck are aligned with the fasteners of the slide blocks, at the front of the main deck.

5. Remove the fasteners securing the white slide blocks to the main deck. Set the slide blocks and the fasteners to the side.

6. Activate the foot release latch and slide the extension platform out of the platform.
2-3
Work Tray

How to Remove the Work Tray (if equipped)

1. Turn the key switch to the off position.
2. Disconnect the battery pack from the machine.

**WARNING**
Electrocution/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

3. Disconnect the platform controls coli cord, from the control cable at the platform.
4. Remove the fasteners and spacer securing the platform controls to the platform controls mount. Remove the platform controls from the platform and set the controls to the side.
5. While supporting the work tray, remove the fasteners, bushings and spacers securing the work tray to the steer end, vertical platform rails. Set the fasteners, bushing and spacers to the side. Remove the work tray from the platform.
Mast Components

3-1
Mast

How to Remove the Mast Assembly

**WARNING** Bodily injury hazard. This procedure requires specific repair skills, lifting equipment and a suitable workshop. Attempting this procedure without these skills and tools could result in death or serious injury and significant component damage. Dealer service is strongly recommended.

Note: When removing a hose assembly or fitting, the O-ring on the fitting and/or hose end must be replaced and then torqued to specification during installation. Refer to Section Two, Hydraulic Hose and Fitting Torque Specifications.

Note: Perform this procedure on a firm, level surface, with the mast in the stowed position.

1 Remove the Platform. See 2-1, How to Remove the Platform.

2 Tag and disconnect the power to platform wire harness at the quick disconnect near the Electronic Control Module (ECM).

3 Tag and disconnect the ECM wire harness at the quick disconnect near the ECM.

4 Attach a lifting strap of suitable capacity from an overhead crane to the lifting eye at the top of the mast. Support the mast. Do not apply any lifting pressure.

5 Tag, disconnect and plug the lift cylinder hoses at the function manifold. Cap the fittings.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

6 Remove the fasteners securing the lower rear access cover to the chassis and remove the cover. Set the cover and the fasteners to the side.

7 Tag and disconnect the wire harness from the platform down valve coil at the base of the lift cylinder.

8 Remove the retaining nut securing the platform down coil to the platform down solenoid valve and remove the coil. Set the coil and retaining nut to the side.

9 Remove the platform down solenoid valve from the lift cylinder. Set the valve to the side and plug the cylinder port.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

10 Remove the mast retaining fasteners.

11 Carefully pull the hydraulic hoses free while removing the mast from the machine.

**WARNING** Crushing hazard. The mast assembly could become unbalanced and fall if not properly supported when removed from the machine.

**NOTICE** Component damage hazard. Cables and hoses can be damaged if they are kinked or pinched.

12 Place the mast assembly on a suitable structure capable of supporting it.
How to Disassemble the Mast

**WARNING** Bodily injury hazard. This procedure requires specific repair skills, lifting equipment and a suitable workshop. Attempting this procedure without these skills and tools could result in death or serious injury and significant component damage. Dealer service is strongly recommended.

1. Remove the mast. See 3-1, *How to Remove the Mast Assembly*.

2. Rotate the mast until the carriage is facing up.

3. Remove the socket head retaining fastener from the clevis block on the lift cylinder rod end at the top of the number 1 column.

4. Remove the lift cylinder barrel end mounting fasteners.

5. Loosen the lift cylinder mounting bracket fasteners.

6. Support the cylinder and carefully slide it out of the mast assembly.

**WARNING** Crushing hazard. The lift cylinder could become unbalanced and fall if not properly supported when removed from the machine.
7 Remove the cover from the top of each column.
8 Remove the adjustment nuts from all of the sequencing cables.
9 Slide the carriage toward the top of the mast assembly enough to remove the tension on the lifting chains.
10 Slide the column below the carriage toward the top of the mast assembly approximately 6 inches / 15 cm to access the idler wheel mounting fasteners.
11 Hold the idler wheel axle from turning by placing a screwdriver through the hole in the axle. Remove the axle mounting fasteners and remove the idler wheel assembly.
Note: Label the location and orientation of each idler wheel assembly.
12 Remove the adjustment nuts from the chain tension rocker on the carriage.
13 Slide the carriage out the bottom of the mast assembly.
14 Lay the chains out on the floor at the top of the mast.
Note: Do not allow the chains to become twisted or dirty.
15 Remove the adjustment nuts from the chain tension rocker on the column.
16 Remove the column by sliding the column out the bottom of the mast.
17 Push the next column toward the top of the mast to access the idler wheel assembly mounting fasteners.
18 Hold the idler wheel axle from turning by placing a screwdriver through the hole in the axle. Remove the axle mounting fasteners, and remove the idler wheel assembly.
19 Remove the adjustment nuts from the chain tension rocker on the column.
20 Slide the column out the bottom of the mast.
21 Repeat steps 17 through 20 for each remaining column.
Note: If the chains are to be removed, mark the location and label each chain before removal.
How to Assemble the Mast

WARNING Bodily injury hazard. This procedure requires specific repair skills, lifting equipment and a suitable workshop. Attempting this procedure without these skills and tools could result in death or serious injury and significant component damage. Dealer service is strongly recommended.

1. Thoroughly clean all columns.
2. Secure the number 1 column to the work table and lay the chains out on the floor.
   Note: Do not allow the chains to become twisted or dirty.
3. Apply a generous amount of Boe-lube wax to the inside and outside channels of each column.
4. Slide the number 2 column into the number 1 column.
5. Lay the number 2 column chains on the floor.
   Note: Do not allow the chains to become twisted or dirty.
6. Lay the number 1 column chains inside the number 2 column.
7. Slide the number 3 column into the number 2 column.
8. When the number 3 column is almost all the way in, guide the number 1 column chains into the chain tension rocker on the number 3 column.
9. Install the adjustment nuts on the number 1 column chains. Tighten the adjustment nuts until the lifting chains have equal tension and the chain tension rocker is centered in the inspection hole in the column.
10. Lay the number 3 column chains on the floor.
    Note: Do not allow the chains to become twisted or dirty.
11. Lay the number 2 column chains inside the number 3 column.
12. Follow steps 4 through 11 for each remaining column and the carriage.
13. After all the columns are assembled, the idler wheel assemblies can be installed.
14. Remove the tension from the lifting chains on the number 2 column by pushing the number 3 column towards the top of the mast.
15. Install the idler wheel assembly in the top of the number 2 column. Tighten the mounting fasteners.
   Note: Confirm that all idler wheels rotate smoothly with no excessive side movement, or rub on the inside of the column. Replace worn shims if necessary.
16. Repeat steps 14 and 15 for each remaining idler wheel assembly.
17. Confirm that all of the idler wheel axle mounting fasteners are flush with the column.

NOTICE Component damage hazard. The roller wheels may be damaged if the idler wheel axle mounting fasteners are not flush with the column.

18. Install the mast assembly on the drive chassis. Adjust the lifting chains. See 3-3, How to Adjust the Lifting Chains.
3-2 Glide Pads

Glide pads, used on the GR-12, GR-15, QS-12R, QS-15R, QS-12W and QS-15W, and wear pads used on the GR-20, QS-20R and QS-20W, are used to provide a uniform fit between the columns as the mast extends and retracts. Over time, it may be necessary to adjust the glide pads to ensure good machine performance.

Wear pads are not adjustable and do not require servicing.

**How to Adjust the Glide Pads**

1. Locate the upper and lower glide pad adjustment bolts below each upper roller bolt, on both sides of each column.
2. Hold the glide pad adjustment bolt and loosen the lock nut on all glide pads.
3. Turn the glide pad adjustment bolt clockwise until the glide pad makes contact with the column. Adjust the glide pads on both sides of all columns. Be sure the sides of the columns are even to within 1/8 inch / 3 mm of each other.
4. On the number 1 column, secure the upper and lower glide pad bolts on both sides of the mast. Hold the glide pad adjustment bolt and torque the lock nut to 12 in-lbs / 1.35 Nm. Be sure the glide pad bolt does not turn.
5. Repeat step 5 for the upper and lower glide pads on both sides of the each column of the mast. Start with the number 2 column and work toward the carriage.

3-3 Lifting Chains

**How to Adjust the Lifting Chains**

1. Mark the column to be adjusted.
2. Raise the platform approximately 6 feet / 2 m.
3. Place a lifting strap of suitable capacity from an overhead crane under the platform. Support the platform. Do not apply any lifting pressure.

**NOTICE** Component damage hazard. The platform railings and platform extension deck (if equipped) can be damaged if they are used to lift the platform. Do not attach the lifting strap to the platform railings or the platform extension deck.

4. Turn the adjustment lock nuts evenly on both sides of the chain tension rocker clockwise to raise the column or counterclockwise to lower the column.

Note: The chain tensioner rocker is located near the bottom of each column.

5. Fully lower the platform and confirm the alignment of the columns. Repeat steps 2 through 5 if necessary.

6. Confirm that the chain tensioner bracket is centered in the inspection hole.
# How to Inspect the Lifting Chains

<table>
<thead>
<tr>
<th>Inspection</th>
<th>Procedure</th>
<th>Inspection Failure</th>
<th>Inspection Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wear</strong></td>
<td>Count out 16 chain links and measure pin to pin centerline dimension with a steel measuring tape. Note: Measure a section of chain that moves over the idler wheels.</td>
<td>When the length of the 16 links (pin to pin) measure more than 8.25 inches / 21 cm for 1/2 inch / 12.7mm chain or 10.31 inches / 26.1 cm for 5/8 inch / 15.9 mm chain.</td>
<td>Replace both chains on that column. Replace entire chain. Do not repair just the affected portion of the chain.</td>
</tr>
<tr>
<td><strong>Rust and Corrosion</strong></td>
<td>Visually inspect the chains for rust and corrosion.</td>
<td>Evidence of rust or corrosion.</td>
<td>Remove chain and inspect for cracked plates (see inspection of cracked plates). If no cracks are found, lubricate chain with motor oil (SAE 40) and install chain.</td>
</tr>
<tr>
<td><strong>Tight Joints</strong></td>
<td>Inspect chain link joints for easy movement.</td>
<td>Joints that do not flex freely or are binding.</td>
<td>If rust and corrosion is found, refer to Failure Remedy for rust and corrosion. If link plates or pins are bent or deformed, replace entire chain. Replace both chains on that column. Do not repair just the affected portion of the chain.</td>
</tr>
</tbody>
</table>

Visually inspect the chains for lubrication. When external surfaces are not protected with a layer of oil. Lubricate chain with motor oil (SAE 40W).

3-4 Lift Cylinder

The lift cylinder is equipped with a normally closed solenoid valve to prevent movement in the event of a hydraulic line failure.

How to Remove the Lift Cylinder

**WARNING** Bodily injury hazard. This procedure requires specific repair skills, lifting equipment and a suitable workshop. Attempting this procedure without these skills and tools could result in death or serious injury and significant component damage. Dealer service is strongly recommended.

Note: When removing a hose assembly or fitting, the O-ring on the fitting and/or hose end must be replaced and then torqued to specification during installation. Refer to Section Two, Hydraulic Hose and Fitting Torque Specifications.

1. Remove the mast. See 3-1, How to Remove the Mast Assembly.
2. Rotate the mast until the carriage is facing down.
3. Remove the socket head retaining fastener from the clevis block on the lift cylinder rod end at the top of the number 1 column.
4. Remove the lift cylinder barrel end mounting fasteners.
5. Loosen the lift cylinder mounting bracket fasteners.
6. Support the cylinder and carefully slide it out of the mast assembly.

**WARNING** Crushing hazard. The lift cylinder could become unbalanced and fall if not properly supported when removed from the mast.
Ground Controls

4-1
Level Sensor

The Electronic Control Module (ECM) is programmed to deactivate the lift and drive functions and activate an alarm when a signal is received from the level sensor.

The tilt alarm sounds when the incline of the chassis exceeds 1.5° to the side, or 3° to the front or rear.

How to Install and Calibrate the Level Sensor

Tip-over hazard. Failure to install or calibrate the level sensor as instructed will compromise machine stability and cause the machine to tip over, resulting in death or serious injury. Do not install or calibrate the level sensor other than specified in this procedure.

Note: Perform this procedure with the machine on a firm, level surface, free of obstructions.

Note: Perform this procedure with the platform in the stowed position.

If you are not installing a new level sensor, proceed to step 6.

1 Tag and disconnect the level sensor wire harness from the chassis wire harness.

2 Remove the level sensor adjusting fasteners. Remove the level sensor from the machine.

3 Place the new level sensor onto the level sensor base with the "X" on the level sensor closest to the mast of the machine and the "Y" on the level sensor closest to the steer end of the machine.

Tip-over hazard. The level sensor must be installed with the "X" on the level sensor closest to the mast of the machine and the "Y" on the level sensor closest to the steer end of the machine. Failure to install the tilt level sensor as instructed could result in the machine tipping over, causing death or serious injury.
4 Install the level sensor adjusting fasteners through the level sensor and springs, and into the mount. Tighten the fasteners and measure the distance between the level sensor and the level sensor mount.

\( \bigcirc \) Result: The measurement should be approximately \( \frac{3}{8} \) inch / 10 mm.

5 Connect the chassis wire harness to the level sensor wire harness.

6 Tighten the level sensor adjusting fasteners until the bubble in the top of the level sensor is centered in the calibration circles.

7 Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

\( \bigcirc \) Result: The tilt sensor alarm should not sound.

8 Center a lifting jack under the drive chassis at the ground controls side of the machine.

9 Raise the machine approximately 2 inches / 5 cm.

10 **GR-12, GR-15, QS-12R, QS-15R, QS-12W and QS-15W:** Place a 0.65 x 6 x 6 inch / 1.65 x 15 x 15 cm thick steel block under both wheels at the ground controls side of the machine.

**GR-20, QS-20R and QS-20W:** Place a 0.7 x 6 x 6 inch / 1.78 x 15 x 15 cm thick steel block under both wheels at the ground controls side of the machine.

11 Lower the machine onto the blocks.

12 Raise the platform approximately 1 foot / 30 cm.

\( \bigcirc \) Result: The level sensor alarm should not sound.

\( \bigx \) Result: The level sensor alarm does sound. Adjust the level sensor retaining fasteners just until the level sensor alarm does not sound.

13 Lower the platform to the stowed position.

14 Raise the machine slightly.

15 Remove the blocks from under both wheels.

16 Lower the machine and remove the jack.

17 Center a lifting jack under the drive chassis at the tank side of the machine.
18 Raise the machine approximately 2 inches / 5 cm.

19 **GR-12, GR-15, QS-12R, QS-15R, QS-12W and QS-15W**: Place a 0.79 x 6 x 6 inch / 2 x 15 x 15 cm thick steel block under both wheels at the tank side of the machine. **GR-20, QS-20R and QS-20W**: Place a 0.85 x 6 x 6 inch / 2.16 x 15 x 15 cm thick steel block under both wheels at the tank side of the machine.

20 Lower the machine onto the blocks.

21 Raise the platform approximately 1 foot / 30 cm.
- **Result**: The platform should stop and an alarm should sound.
- **Result**: The platform does not stop or the level sensor alarm does not sound. Adjust the level sensor until the alarm just begins to sound OR the down limit switch may need to be adjusted.

22 Lower the platform to the stowed position.

23 Raise the machine slightly.

24 Remove the blocks from under both wheels.

25 Lower the machine and remove the jack.

26 Center a lifting jack under the drive chassis at the steer end of the machine.

27 Raise the machine approximately 2 inches / 5 cm.

28 Place a 2.18 x 6 x 6 inch / 5.54 x 15 x 15 cm thick steel block under both wheels at the steer end of the machine.

29 Lower the machine onto the blocks.

30 Raise the platform approximately 1 foot / 30 cm.
- **Result**: The level sensor alarm should not sound.
- **Result**: The level sensor alarm does sound. The level sensor is faulty and must be replaced. Repeat this procedure beginning with step 1.

31 Raise the machine slightly.

32 Remove the blocks from under both wheels.

33 Lower the machine and remove the jack.

34 Center a lifting jack under the drive chassis at the non-steer end of the machine.

35 Raise the machine approximately 2 inches / 5 cm.

36 Place a 2.4 x 6 x 6 inch / 6.1 x 15 x 15 cm thick steel block under both wheels at the non-steer end of the machine.

37 Raise the platform approximately 1 foot / 30 cm.
- **Result**: The platform should stop and an alarm should sound.
- **Result**: The platform does not stop or the level sensor alarm does not sound. The level sensor is faulty and must be replaced. Repeat this procedure beginning with step 1.

38 Lower the platform to the stowed position.

39 Raise the machine slightly.

40 Remove the blocks from under both wheels.

41 Lower the machine and remove the jack.
Hydraulic Pump

5-1 Function Pump

The hydraulic pump is attached to the motor which makes up the hydraulic power unit.

How to Test the Hydraulic Pump

Note: When removing a hose assembly or fitting, the fitting and/or hose end must be torqued to specification during installation. Refer to Section 2, Hydraulic Hose and Fitting Torque Specifications.

1 Tag, disconnect and plug the high pressure hydraulic hose from the hydraulic pump.

WARNING Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

2 Connect a 0 to 5000 psi / 0 to 350 bar pressure gauge to the high pressure port on the pump.

3 Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

4 Activate the platform up function from the ground controls.

- Result: If the pressure gauge reads 3200 psi / 221 bar, immediately stop. The pump is good.

- Result: If pressure fails to reach 3200 psi / 221 bar, the pump is bad and will need to be serviced or replaced.

NOTICE Component damage hazard. There is no relief valve in the hydraulic pump and the pump can be damaged if the pressure is allowed to exceed 3200 psi / 221 bar. When testing the pump, activate the pump in one second intervals until 3200 psi / 221 bar is confirmed. Do not over-pressurize the pump.

5 Remove the pressure gauge and reconnect the hydraulic hose. Torque to specification.

WARNING Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.
How to Remove the Hydraulic Pump

Note: When removing a hose assembly or fitting, the O-ring on the fitting and/or hose end must be replaced and then torqued to specification during installation. Refer to Section Two, Hydraulic Hose and Fitting Torque Specifications.

1 Tag, disconnect and plug the hydraulic supply hard line at the pump. Cap the fitting on the pump.

2 Tag, disconnect and plug the high pressure hose at the pump. Cap the fitting on the pump.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

3 Remove the pump mounting bolts. Carefully remove the pump.

**DANGER** Tip-over hazard. After replacing the hydraulic pump, it is critical to return the function speed settings to original factory specifications. Failure to restore the machine to original factory specifications could cause the machine to tip over, resulting in death or serious injury.

Valve Adjustments - Function Manifold

How to Adjust the System Relief Valve

Note: Be sure that the hydraulic oil level is at the FULL mark on the hydraulic tank.

1. Locate the system relief valve on the function manifold (item I).

2. Connect a 0 to 5000 psi / 0 to 350 bar pressure gauge to the test port on the function manifold (schematic item A).

3. Chock both sides of the wheels at the steer end of the machine.

4. Remove the platform controls from the platform.

Note: Perform this test from the ground with the platform controls. Do not stand in the platform.

5. Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

6. Press and hold the function enable switch.

7. Move and hold the joystick fully in either direction while observing the pressure reading on the pressure gauge. Note the pressure. Refer to Section 2, Specifications.

8. Turn the machine off. Hold the system relief valve with a wrench and remove the cap (schematic item I).

9. Adjust the internal hex socket. Turn it clockwise to increase the pressure or counterclockwise to decrease the pressure.

Tip-over hazard. Failure to adjust the relief valves to specification could result in the machine tipping over, causing death or serious injury. Do not adjust the relief valve pressures higher than specifications.

10. Install the relief valve cap.

11. Repeat steps 5 through 7 to confirm the relief valve pressure.
How to Adjust the Platform Lift Relief Valve

Note: Be sure that the hydraulic oil level is at the FULL mark on the hydraulic tank.

1 Locate the system relief valve on the function manifold (item I).

2 Connect a 0 to 5000 psi / 0 to 350 bar pressure gauge to the test port on the function manifold (schematic item A).

3 Chock both sides of the wheels at the steer end of the machine.

4 Remove the platform controls from the platform.

5 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

6 Press and hold the function enable switch.

7 Move and hold the joystick fully in either direction while observing the pressure reading on the pressure gauge. Note the pressure. Refer to Section 2, Specifications.

8 Turn the machine off. Hold the system relief valve with a wrench and remove the cap (hydraulic schematic item I).

9 Adjust the internal hex socket. Turn it clockwise to increase the pressure or counterclockwise to decrease the pressure.

**DANGER** Tip-over hazard. Failure to adjust the relief valves to specification could result in the machine tipping over, causing death or serious injury. Do not adjust the relief valve pressures higher than specifications.

10 Install the relief valve cap.

11 Repeat steps 4 through 7 to confirm the relief valve pressure.

12 Place maximum rated load into the platform. Secure the load to the platform. Refer to Section 2, Specifications.

13 Turn the key switch to ground control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

---

</thead>
<tbody>
<tr>
<td>test port</td>
<td>system relief valve</td>
<td>lift relief valve</td>
</tr>
</tbody>
</table>
14 Hold the lift relief valve with a wrench and remove the cap (schematic item C).

15 While activating the platform up function, adjust the internal hex socket clockwise, just until the platform fully raises.

16 Fully lower the platform.

17 Add an additional 50 pounds / 22.7 kg to the platform. Secure the additional weight.

18 Attempt to raise the platform.

- Result: The power unit should **not** be able to lift the platform.

- Result: If the power unit lifts the platform, adjust the internal hex socket counterclockwise until the platform will not raise.

19 Install the relief valve cap.

20 Remove the weight from the platform.

21 Bleed the hydraulic system by raising the platform to full height. If the pump cavitates or the platform fails to reach full height, add hydraulic oil until the pump is functioning correctly. Do not overfill the hydraulic tank.

**NOTICE** Component damage hazard. Do not continue to operate the machine if the hydraulic pump is cavitating.

**How to Adjust the Steer Relief Valve**

Note: Be sure that the hydraulic oil level is at the **FULL** mark on the hydraulic tank.

1 Locate the steer relief valve on the function manifold (schematic item G).

2 Connect a 0 to 5000 psi / 0 to 350 bar pressure gauge to the test port (schematic item A) on the function manifold.

3 Remove the platform controls from the platform.

Note: Perform this test from the ground with the platform controls. Do not stand in the platform.
4 Turn the key switch to platform control and pull out the red Emergency Stop button to the on position at both the ground and platform controls.

5 Activate the function enable switch and press and hold the steer thumb rocker switch to the right. Allow the wheels to completely turn to the right. Continue holding the switch while observing the pressure reading on the pressure gauge. Note the pressure. Refer to Section 2, Specifications.

6 Press and hold the steer thumb rocker switch to the left. Allow the wheels to completely turn to the left. Continue holding the switch while observing the pressure reading on the pressure gauge.

7 Turn the machine off. Hold the steer relief valve with a wrench and remove the cap (schematic item G).

8 Adjust the internal hex socket. Turn it clockwise to increase the pressure or counterclockwise to decrease the pressure.

   NOTICE Component damage hazard. Do not adjust the relief valve pressures higher than specifications.

9 Install the relief valve cap.

10 Repeat steps 5 through 6 to confirm the relief valve pressure.
6-3
Valve Coils

How to Test a Coil

A properly functioning coil provides an electromagnetic force which operates the solenoid valve. Critical to normal operation is continuity within the coil. Zero resistance or infinite resistance indicates the coil has failed.

Since coil resistance is sensitive to temperature, resistance values outside specification can produce erratic operation. When coil resistance decreases below specification, amperage increases. As resistance rises above specification, voltage increases.

While valves may operate when coil resistance is outside specification, maintaining coils within specification will help ensure proper valve function over a wide range of operating temperatures.

Electrocution/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

Note: If the machine has been in operation, allow the coil to cool at least 3 hours before performing this test.

1 Tag and disconnect the wiring from the coil to be tested.

2 Test the coil resistance using a multimeter set to resistance (Ω). Refer to the Valve Coil Resistance Specification table.

Result: If the resistance is not within the adjusted specification, plus or minus 10%, replace the coil.

Valve Coil Resistance Specification

Note: The following coil resistance specifications are at an ambient temperature of 68°F / 20°C. As valve coil resistance is sensitive to changes in air temperature, the coil resistance will typically increase or decrease by 4% for each 18°F / -7.7°C that your air temperature increases or decreases from 68°F / 20°C.

Valve Coil Resistance Specifications

<td>6.25Ω</td>
</tr>
</tbody>
</table>
How to Test a Coil Diode

Genie incorporates spike suppressing diodes in all of its coils. Properly functioning coil diodes protect the electrical circuit by suppressing voltage spikes. Voltage spikes naturally occur within a function circuit following the interruption of electrical current to a coil. Faulty diodes can fail to protect the electrical system, resulting in a tripped circuit breaker or component damage.

**WARNING** Electrocutition/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

1. Test the coil for resistance. See 6-3, *How to Test a Coil*.

2. Connect a 10Ω resistor to the negative terminal of a known good 9V DC battery. Connect the other end of the resistor to a terminal on the coil.

   Note: The battery should read 9V DC or more when measured across the terminals.

3. Set a multimeter to read DC amperage.

   Note: The multimeter, when set to read DC amperage, should be capable of reading up to 800 mA.

4. Connect the negative lead to the other terminal on the coil.

   Note: If testing a single-terminal coil, connect the negative lead to the internal metallic ring at either end of the coil.

5. Momentarily connect the positive lead from the multimeter to the positive terminal on the 9V battery. Note and record the current reading.

6. At the battery or coil terminals, reverse the connections. Note and record the current reading.

   ☑ Result: Both current readings are greater than 0 mA and are different by a minimum of 20%. The coil is good.

   ☣ Result: If one or both of the current readings are 0 mA, or if the two current readings do not differ by a minimum of 20%, the coil and/or its internal diode are faulty and the coil should be replaced.
Hydraulic Tank

7-1

Hydraulic Tank

The primary functions of the hydraulic tank are to cool and deaerate the hydraulic fluid during operation. It utilizes internal suction strainers for the pump supply lines and has an external return line filter.

How to Remove the Hydraulic Tank

Component damage hazard. The work area and surfaces where this procedure will be performed must be clean and free of debris that could get into the hydraulic system.

Note: When removing a hose assembly or fitting, the fitting and/or hose end must be torqued to specification during installation. Refer to Section 2, Hydraulic Hose and Fitting Torque Specifications.

Note: Perform this procedure with the platform in the stowed position.

1 Tag, disconnect and plug the hydraulic supply hard line at the pump. Cap the fitting on the pump. Remove the hard line from the tank.

2 Tag, disconnect and plug the return hard line at the hydraulic filter. Cap the fitting on the filter.

WARNING Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

3 Remove the hydraulic tank retaining fasteners and remove the hydraulic tank from the machine.

Yoke and Drive Motor

How to Remove the Yoke and Drive Motor Assembly

Note: When removing a hose assembly or fitting, the fitting and/or hose end must be torqued to specification during installation. Refer to Section 2, Hydraulic Hose and Fitting Torque Specifications.

1 Block the wheels at the non-steer end of the machine.
2 Remove the cotter pin from the wheel castle nut at the steer end of the machine.
   Note: Always replace the cotter pin with a new one when removing the castle nut.
3 Loosen the wheel castle nut. Do not remove it.
4 Center a lifting jack under the drive chassis at the steer end of the machine.
5 Raise the machine approximately 6 inches / 15 cm. Place blocks under the chassis for support.

   ◆ WARNING Crushing hazard. The chassis could fall if not properly supported.
6 Remove the wheel castle nut. Remove the wheel.
7 Tag, disconnect and plug the hydraulic hoses on the drive motor. Cap the fittings on the drive motor.

   ◆ WARNING Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

   ◆ NOTICE Component damage hazard. Hoses can be damaged if they are kinked or pinched.
8 Support and secure the yoke assembly to an appropriate lifting device.
9 Remove the retaining fastener from the steer link at the yoke assembly.
   Note: Observe and note the quantity and location of the spacers, when disconnecting the steer link from the yoke assembly.
10 Remove the retaining fastener from the rear of the yoke pivot shaft.
   Note: The pivot shaft retaining fastener is located below the main deck.
11 Lower the yoke assembly out of the chassis.

   ◆ CAUTION Bodily injury hazard. The yoke/motor assembly may fall if not properly supported when removed from the machine.
How to Remove a Drive Motor

1 Block the wheels at the non-steer end of the machine.

2 Remove the cotter pin from the wheel castle nut of the motor to be removed at the steer end of the machine.

Note: Always replace the cotter pin with a new one when removing the castle nut.

3 Loosen the wheel castle nut. Do not remove it.

4 Center a lifting jack under the drive chassis at the steer end of the machine.

5 Raise the machine approximately 2 inches / 5 cm. Place blocks under the chassis for support.

**WARNING** Crushing hazard. The chassis could fall if not properly supported.

6 Remove the wheel castle nut. Remove the wheel.

7 Tag, disconnect and plug the hydraulic hoses on the drive motor. Cap the fittings on the drive motor.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

**NOTICE** Component damage hazard. Hoses can be damaged if they are kinked or pinched.

8 Remove the drive motor mounting fasteners. Remove the motor.

8-2  Steer Cylinder

How to Remove the Steer Cylinder

Note: When removing a hose assembly or fitting, the O-ring on the fitting and/or hose end must be replaced and then torqued to specification during installation. Refer to Section Two, Hydraulic Hose and Fitting Torque Specifications.

1. Block the wheels at the non-steer end of the machine.
2. Remove the steer cylinder hose guard bracket from the machine.
3. Remove the pin retaining fasteners from the steer cylinder barrel-end pivot pin. Remove the pin.
   Note: Observe and note the quantity and location of the spacers when removing the pivot pin.
4. Remove the pin retaining fasteners from the steer cylinder rod-end pivot pin. Remove the pin.
   Note: Observe and note the quantity and location of the spacers when removing the pivot pin.
5. Remove the steer cylinder from the machine.
6. Tag, disconnect and plug the hydraulic hoses from the steer cylinder. Cap the fittings.

**WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

**NOTICE** Component damage hazard. Hoses can be damaged if they are kinked or pinched.

8-3  Steer Bellcrank

How to Remove the Steer Bellcrank

1. Remove the steer cylinder. See 8-2, How to Remove the Steer Cylinder.
2. Center a lifting jack under the drive chassis at the steer end of the machine.
3. Raise the machine approximately 14 inches / 36 cm. Place blocks under the chassis for support.
   **WARNING** Crushing hazard. The chassis could fall if not properly supported.
4. Turn the yokes fully to one side of the machine.
5. Remove the fasteners securing the bell crank to the steer yoke.
   Note: Observe and note the quantity and location of the spacers between the bellcrank and the steer links.
6. Turn the yokes fully to the opposite side of the machine.
   Note: Observe and note the quantity and location of the spacers between the bellcrank and the steer links.
7. Remove the fasteners securing the bell crank to the steer yoke.
8. Remove the bellcrank from the machine.
   Note: Observe and note the quantity and location of the spacers between the bellcrank and the steer links.
9-1
Drive Brake

How to Remove a Drive Brake

Note: When removing a hose assembly or fitting, the fitting and/or hose end must be torqued to specification during installation. Refer to Section 2, Hydraulic Hose and Fitting Torque Specifications.

1 Block the wheels at the steer end of the machine.
2 Remove the cotter pin from the wheel castle nut at the non-steer end of the machine.
Note: Always replace the cotter pin with a new one when removing the castle nut.
3 Loosen the wheel castle nut. Do not remove it.
4 Center a lifting jack under the drive chassis at the non-steer end.
5 Raise the machine approximately 2 inches / 5 cm. Place blocks under the chassis for support.
WARNING Crushing hazard. The chassis could fall if not properly supported.
6 Remove the wheel castle nut. Remove the wheel.
7 Tag, disconnect and plug the hydraulic hose from the brake. Cap the fitting on the brake.
WARNING Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.
8 Place a lifting jack under the brake for support.
9 Remove the fasteners that attach the brake to the drive chassis. Remove the brake.
CAUTION Crushing hazard. The brake will fall if not properly supported when the mounting fasteners are removed.

Note: 'alpha' callouts refer to corresponding notes on the hydraulic schematic.
11-1

Platform Overload System

Calibrate the Platform Overload System (if equipped)

Note: Perform this procedure with the machine on a firm, level surface.

1. Raise the platform approximately 2 feet / 70 cm.
2. Tag and disconnect the wire harness from the load sense limit switch.

Note: The load sense limit switch is located near the platform support.

3. Set a multi-meter to measure continuity. Connect the leads from the multi-meter to the black and red wires disconnected from the limit switch in step 2.

4. Determine the maximum platform capacity. Refer to the machine serial plate.

5. Using a suitable lifting device, place a test weight equal to that of the maximum platform capacity at the center of the platform floor. Secure the weight to the platform. Refer to the chart below.

<table>
<thead>
<tr>
<th>Platform Type</th>
<th>Maximum Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard Platform (GR-12, GR-15)</td>
<td>227 kg</td>
</tr>
<tr>
<td>Standard Platform (GR-20)</td>
<td>159 kg</td>
</tr>
<tr>
<td>Stockpicker Platform (GR-12, GR-15, QS-12R, QS-15R, QS-12W and QS-15W)</td>
<td>227 kg</td>
</tr>
<tr>
<td>Stockpicker Platform (GR-20, QS-20R and QS-20W)</td>
<td>159 kg</td>
</tr>
</tbody>
</table>

Determine the limit switch trigger point:

6. Gently move the platform up and down by hand, so it bounces 1 to 2 inches / 2.5 to 5 cm.
7. Check the continuity between the black and red wires originating from the limit switch of the platform overload assembly.

- Result: **There is no continuity.** Slowly tighten the load spring adjustment nut by turning it clockwise just until the limit switch closes and shows continuity.

- Result: **There is continuity.** Slowly loosen the load spring adjustment nut by turning it counterclockwise just until the limit switch opens and shows no continuity.

Note: The platform will need to be continuously moved up and down while making adjustments.

Fine adjustment of the switch trigger point:

8. Continue moving the platform up and down and adjust the load spring adjustment nut clockwise or counterclockwise just until the limit switch is alternately opening and closing.

Note: When the limit switch is adjusted correctly, there will be continuity slightly longer than no continuity.

9. Remove the continuity tester from the limit switch wires. Securely install the wires onto the limit switch.
Confirm the setting:

10 Turn the key switch to platform control.

11 Lift the test weight off the platform floor using a suitable lifting device.

12 Place the test weight back onto the platform floor using a suitable lifting device.

* Result: The diagnostic display at the ground controls will show two flat bars and a blinking light, indicating a normal condition, and the diagnostic display at the platform controls will show the battery condition. Refer to Repair procedure 1-3, *How to Determine the Battery Voltage*.

13 Add an additional weight to the platform not to exceed 20% of the maximum rated load. Refer to the machine serial plate.

* Result: The diagnostic display will show 'OL' at both the ground and platform controls. The platform overload system is operating properly.

X Result: The diagnostic display at the ground controls will show two flat bars and a blinking light and the diagnostic display at the platform controls will show the battery condition. The platform overload system is not operating properly. Repeat this procedure beginning with step 1.

14 Test all machine functions from the platform controls.

* Result: All platform control functions should not operate.

15 Turn the key switch to ground control.

16 Test all machine functions from the ground controls.

* Result: All ground control functions should not operate.
Obstruction Sensing System

12-1 Obstruction Sensing Pads

The function of the Obstruction Sensing System is to detect a person or an object standing on the machine chassis. When a person or an object is detected on top of the machine chassis, the machine platform down function will not operate and an alarm will sound.

How to Replace an Obstruction Sensing Pad (QSR models only)

1. Raise the platform approximately 5 feet / 152 cm.
2. Turn the key switch to the off position and disconnect the battery pack from the machine.
3. At the non-steer end of the machine, unlatch the covers and open the ground controls cover.
4. Working with the obstruction sensing pad to be replaced, locate the pad cables.
5. Carefully pull the cables to identify the connector cable located at the ground controls, non-steer end of the machine.
6. After the connector cable has been identified, tag and disconnect the cable from the obstruction sensing pad cables.

Note: If the ground controls side or battery box cover obstruction sensing pad is replaced, carefully remove the appropriate pin from the male Deutsch connector. A new Deutsch pin will have to be installed onto the cable wire of the new ground controls side pad, or battery box cover pad.
7. Using a broad flat metal blade, carefully slide the metal blade under the obstruction pad and work the metal blade under the entire pad to be replaced, until the pad is separated from the chassis or the battery box cover.
8. Remove the pad from the machine and carefully scrape away any excess adhesive from the chassis or battery box cover.
9. Using a suitable solvent, clean the surface were the obstruction sensing pad was removed. Allow the surface to dry thoroughly.
10. Install the new obstruction sensing pad.

Note: It may be necessary to use touch-up paint in the area were the obstruction sensing pad was removed. Let the paint dry completely, before installing the new obstruction sensing pad.
OBSTRUCTION SENSING PADS

Obstruction Sensing Pads

- a: cable connectors
- b: Deutsch connector
- c: battery box
- d: obstruction sensing pad
- e: ground controls side
- f: hydraulic tank side

Ground Controls Side

Non-steer End

Steer End
Before Troubleshooting:

☑️ Read, understand and obey the safety rules and operating instructions in the appropriate operator’s manual on your machine.

☑️ Be sure that all necessary tools and test equipment are available and ready for use.

☑️ Be aware of the following hazards and follow generally accepted safe workshop practices.

⚠️ **DANGER** Crushing hazard. When testing or replacing any hydraulic component, always support the structure and secure it from movement.

⚠️ **WARNING** Electrocuton/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

⚠️ **WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.
About This Section

When a malfunction is discovered, the fault code chart in this section will help a service professional pinpoint the cause of the problem. To use this section, basic hand tools and certain pieces of test equipment are required—voltmeter, ohmmeter, pressure gauges.

General Repair Process

LED Diagnostic Readout

The diagnostic readout displays numerical codes that provide information about the machine operating status and about malfunctions. The dot to the right of the numbers remain on when a fault code is displayed.

The codes listed in the Fault Code Chart describe malfunctions and can aid in troubleshooting the machine by pinpointing the area or component affected.

</table>
Observe and Obey:

- Troubleshooting and repair procedures shall be completed by a person trained and qualified on the repair of this machine.
- Immediately tag and remove from service a damaged or malfunctioning machine.
- Repair any machine damage or malfunction before operating the machine.

Before Troubleshooting:

- Read, understand and obey the safety rules and operating instructions in the appropriate operator's manual on your machine.
- Be sure that all necessary tools and test equipment are available and ready for use.

About This Section

There are two groups of schematics in this section. An illustration legend precedes each group of drawings.

Electrical Schematics

- **WARNING** Electrocuton/burn hazard. Contact with electrically charged circuits could result in death or serious injury. Remove all rings, watches and other jewelry.

Hydraulic Schematics

- **WARNING** Bodily injury hazard. Spraying hydraulic oil can penetrate and burn skin. Loosen hydraulic connections very slowly to allow the oil pressure to dissipate gradually. Do not allow oil to squirt or spray.

General Repair Process

1. Malfunction discovered
2. Identify symptoms
3. Troubleshoot
4. Inspect and test
5. Perform repair
6. Return to service
